Simple Neural Networks and Neural Language Models

Units in Neural Networks

Neural Network Unit

This is not in your brain

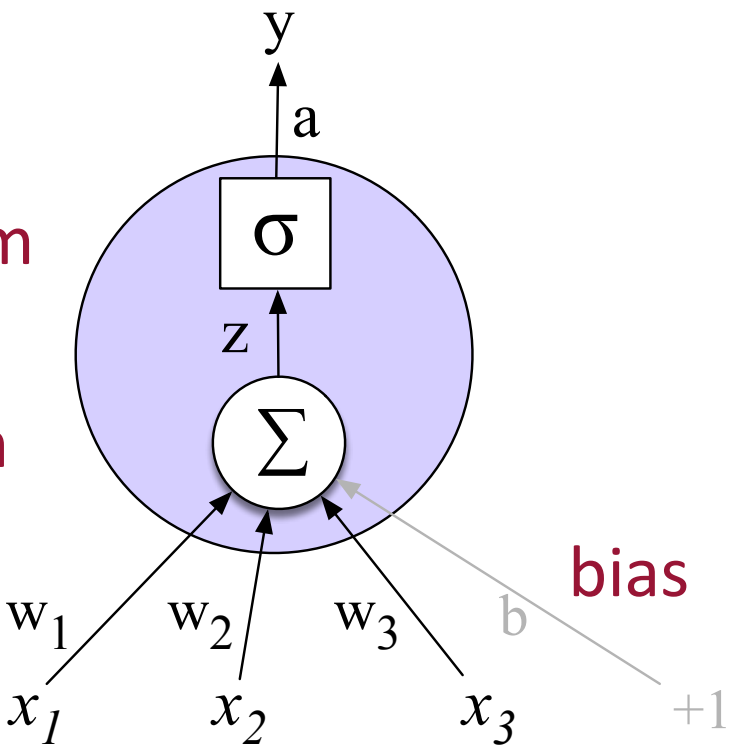

Output value

Non-linear transform

Weighted sum

Weights

Input layer

Neural unit

Take weighted sum of inputs, plus a bias

$$z = b + \sum_i w_i x_i$$

$$z = w \cdot x + b$$

Instead of just using z, we'll apply a nonlinear activation function f:

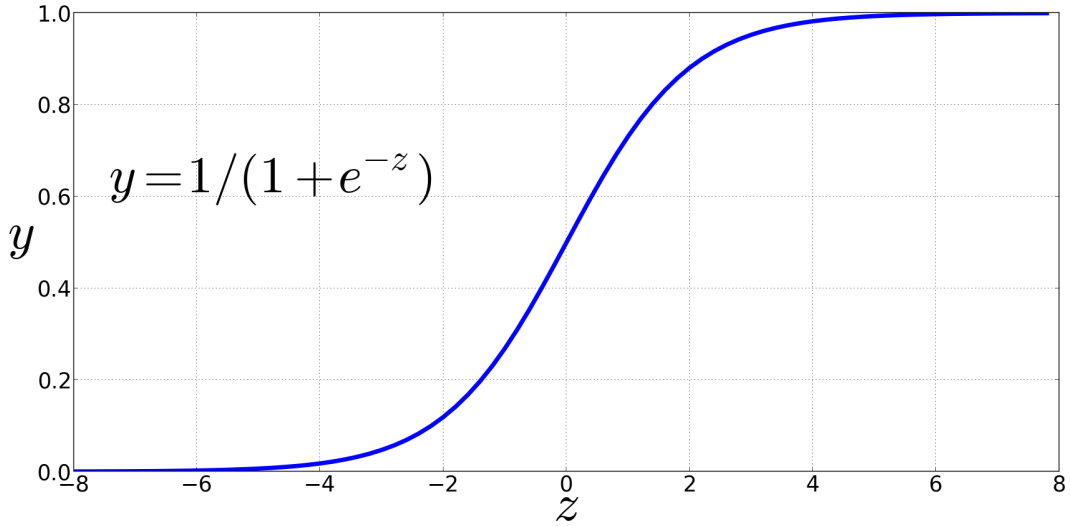

$$y = a = f(z)$$

Non-Linear Activation Functions

We're already seen the sigmoid for logistic regression:

Sigmoid

$$y = \sigma(z) = \frac{1}{1+e^{-z}}$$

Final function the unit is computing

$$y = \sigma(w \cdot x + b) = \frac{1}{1 + \exp(-(w \cdot x + b))}$$

Final unit again

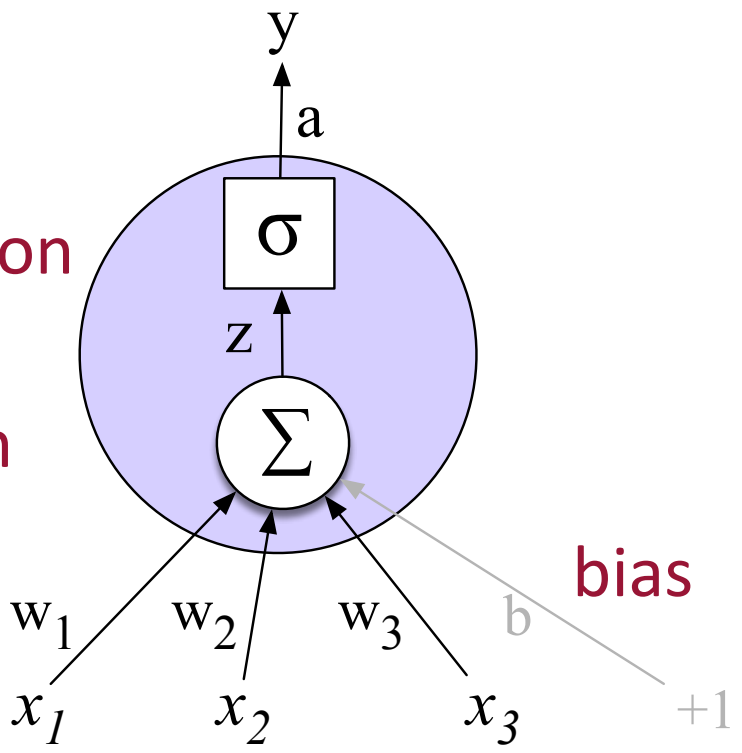

Output value

Non-linear activation function

Weighted sum

Weights

Input layer

An example

Suppose a unit has:

`w = [0.2,0.3,0.9]`

`b = 0.5`

What happens with input x:

`x = [0.5,0.6,0.1]`

$$y = \sigma(w \cdot x + b) =$$

An example

Suppose a unit has:

```
w = [0.2,0.3,0.9]
b = 0.5
```

What happens with the following input x?

```
x = [0.5,0.6,0.1]
```

$$y = \sigma(w \cdot x + b) = \frac{1}{1 + e^{-(w \cdot x + b)}} =$$

An example

Suppose a unit has:

w = [0.2,0.3,0.9]

b = 0.5

What happens with input x:

x = [0.5,0.6,0.1]

$$y = \sigma(w \cdot x + b) = \frac{1}{1 + e^{-(w \cdot x + b)}} =$$

$$\frac{1}{1 + e^{-(.5*.2 + .6*.3 + .1*.9 + .5)}} =$$

An example

Suppose a unit has:

w = [0.2,0.3,0.9]

b = 0.5

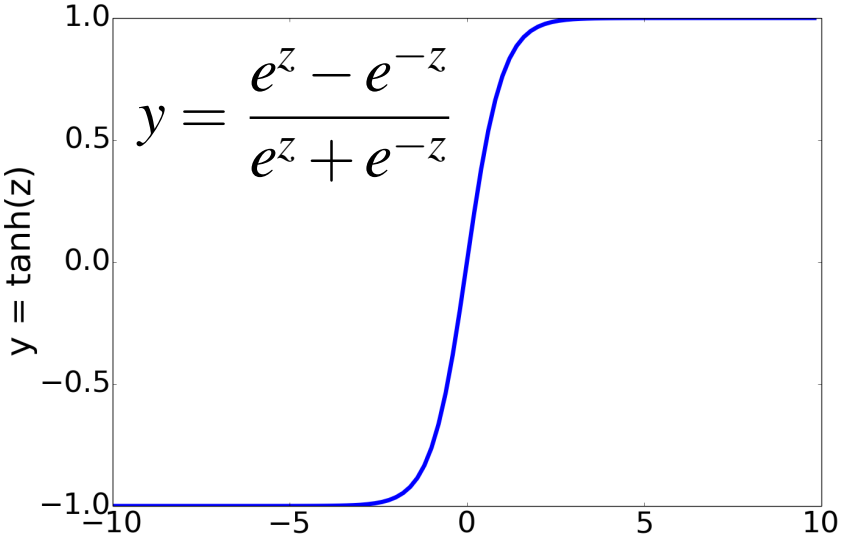

What happens with input x:

x = [0.5,0.6,0.1]

$$y = \sigma(w \cdot x + b) = \frac{1}{1 + e^{-(w \cdot x + b)}} =$$

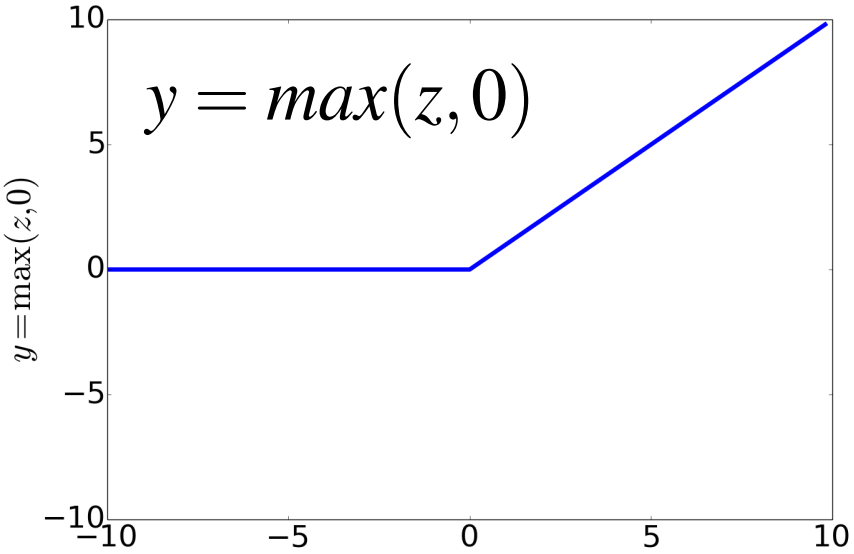

$$\frac{1}{1 + e^{-(.5*.2+.6*.3+.1*.9+.5)}} = \frac{1}{1 + e^{-0.87}} = .70$$

Non-Linear Activation Functions besides sigmoid

tanh

Most Common:

ReLU

Rectified Linear Unit

Simple Neural Networks and Neural Language Models

Units in Neural Networks

Simple Neural Networks and Neural Language Models

The XOR problem

The XOR problem

Minsky and Papert (1969)

Can neural units compute simple functions of input?

AND			OR			XOR		
x1	x2	y	x1	x2	y	x1	x2	y
0	0	0	0	0	0	0	0	0
0	1	0	0	1	1	0	1	1
1	0	0	1	0	1	1	0	1
1	1	1	1	1	1	1	1	0

Perceptrons

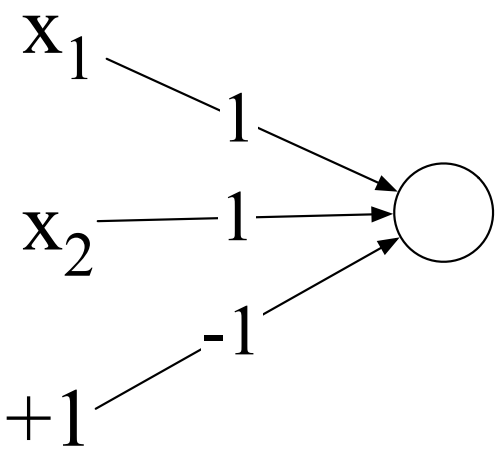

A very simple neural unit

- Binary output (0 or 1)
- No non-linear activation function

$$y = \begin{cases} 0, & \text{if } w \cdot x + b \leq 0 \\ 1, & \text{if } w \cdot x + b > 0 \end{cases}$$

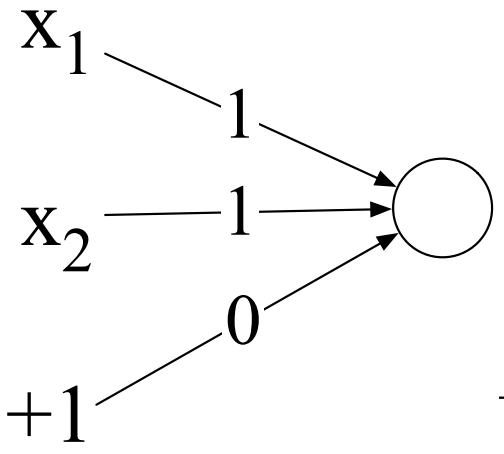

Easy to build AND or OR with perceptrons

$$y = \begin{cases} 0, & \text{if } w \cdot x + b \le 0 \\ 1, & \text{if } w \cdot x + b > 0 \end{cases}$$

AND

AND		
x1	x2	y
0	0	0
0	1	0
1	0	0
1	1	1

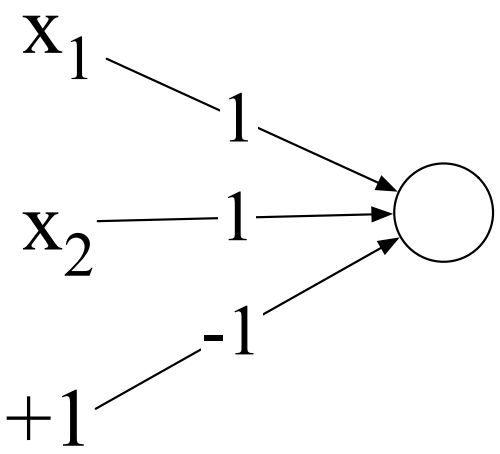

OR

OR		
x1	x2	y
0	0	0
0	1	1
1	0	1
1	1	1

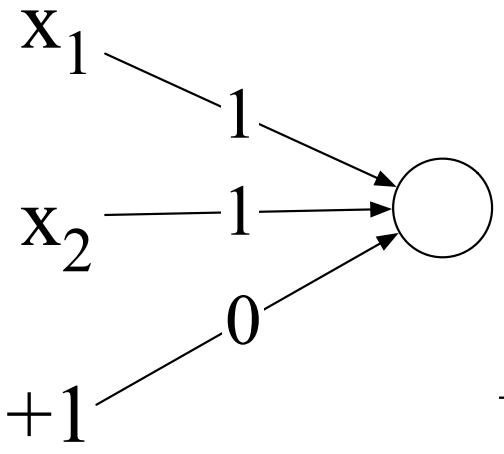

Easy to build AND or OR with perceptrons

$$y = \begin{cases} 0, & \text{if } w \cdot x + b \le 0 \\ 1, & \text{if } w \cdot x + b > 0 \end{cases}$$

AND

AND		
x1	x2	y
0	0	0
0	1	0
1	0	0
1	1	1

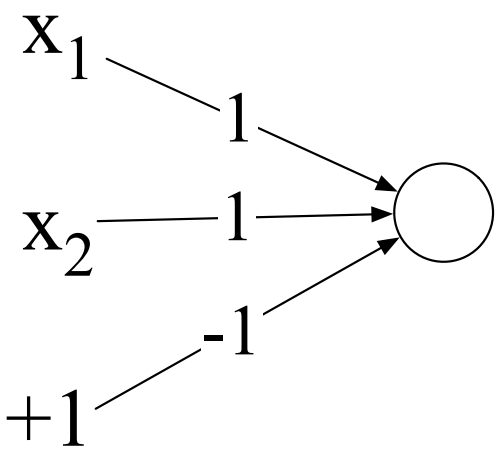

OR

OR		
x1	x2	y
0	0	0
0	1	1
1	0	1
1	1	1

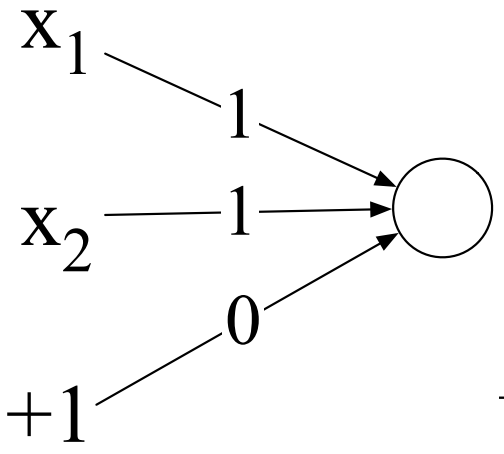

Easy to build AND or OR with perceptrons

$$y = \begin{cases} 0, & \text{if } w \cdot x + b \le 0 \\ 1, & \text{if } w \cdot x + b > 0 \end{cases}$$

AND

AND		
x1	x2	y
0	0	0
0	1	0
1	0	0
1	1	1

OR

OR		
x1	x2	y
0	0	0
0	1	1
1	0	1
1	1	1

Not possible to capture XOR with perceptrons

Pause the lecture and try for yourself!

Why? Perceptrons are linear classifiers

Perceptron equation given x_1 and x_2, is the equation of a line

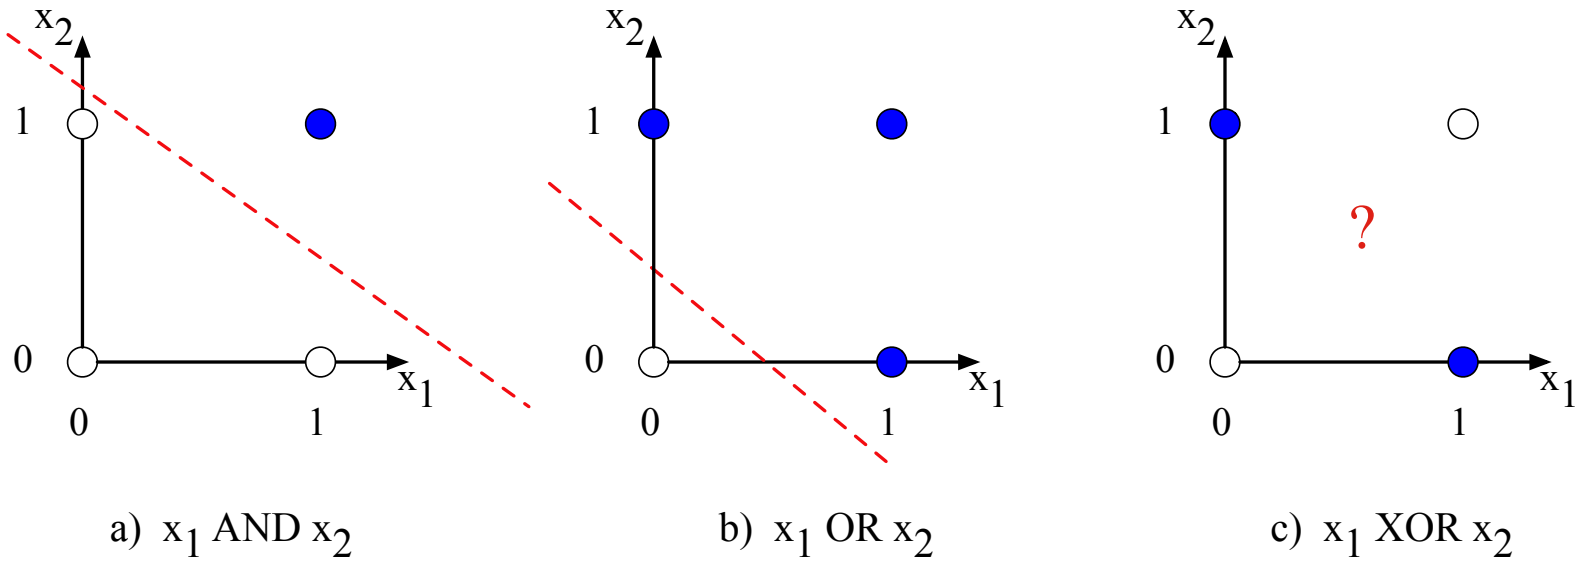

$$w_1 x_1 + w_2 x_2 + b = 0$$

(in standard linear format: $x_2 = (-w_1/w_2)x_1 + (-b/w_2)$)

This line acts as a **decision boundary**

- 0 if input is on one side of the line
- 1 if on the other side of the line

Decision boundaries

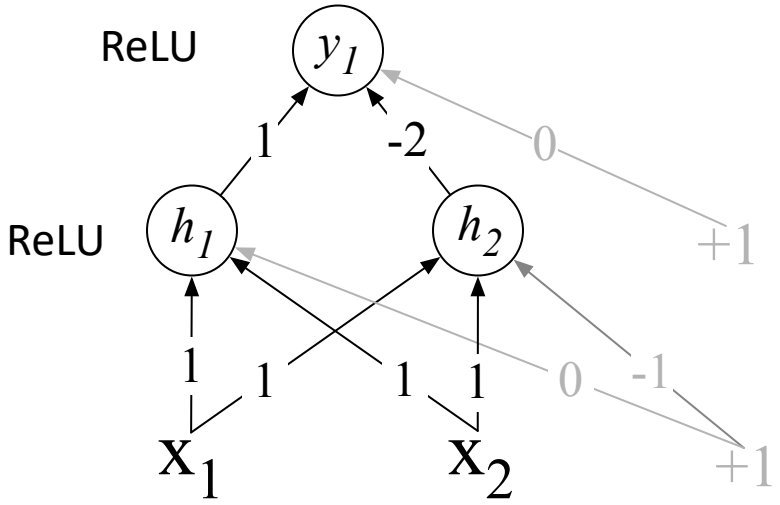

XOR is not a **linearly separable** function!

Solution to the XOR problem

XOR **can't** be calculated by a single perceptron

XOR **can** be calculated by a layered network of units.

XOR		
x1	x2	y
0	0	0
0	1	1
1	0	1
1	1	0

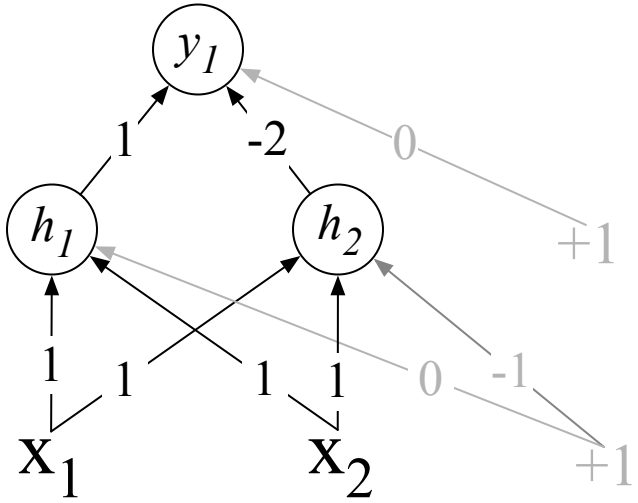

Solution to the XOR problem

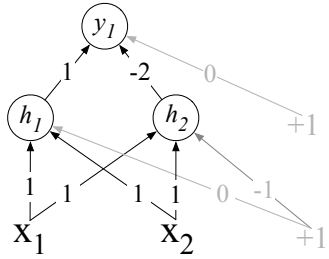

XOR **can't** be calculated by a single perceptron

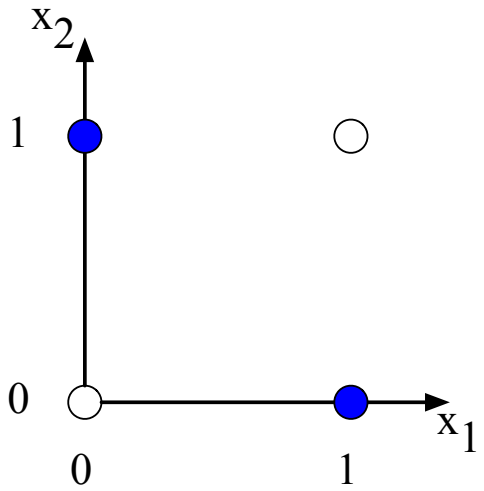

XOR **can** be calculated by a layered network of units.

XOR		
x1	x2	y
0	0	0
0	1	1
1	0	1
1	1	0

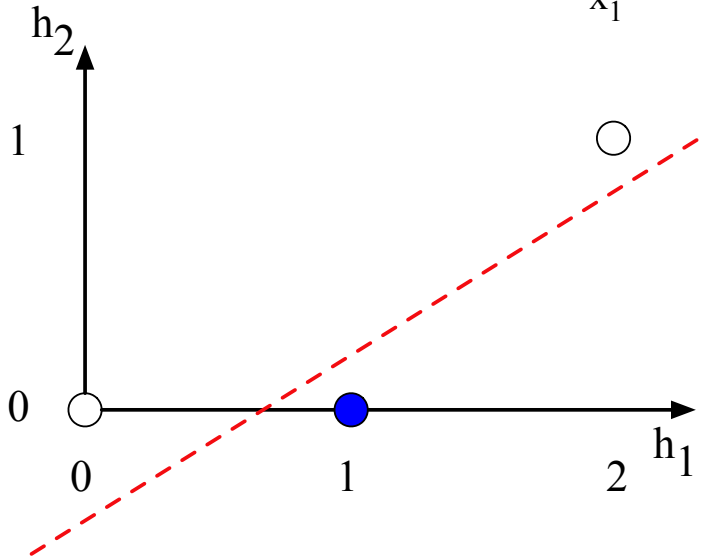

The hidden representation h

a) The original *x* space

b) The new (linearly separable) *h* space

(With learning: hidden layers will learn to form useful representations)

Simple Neural Networks and Neural Language Models

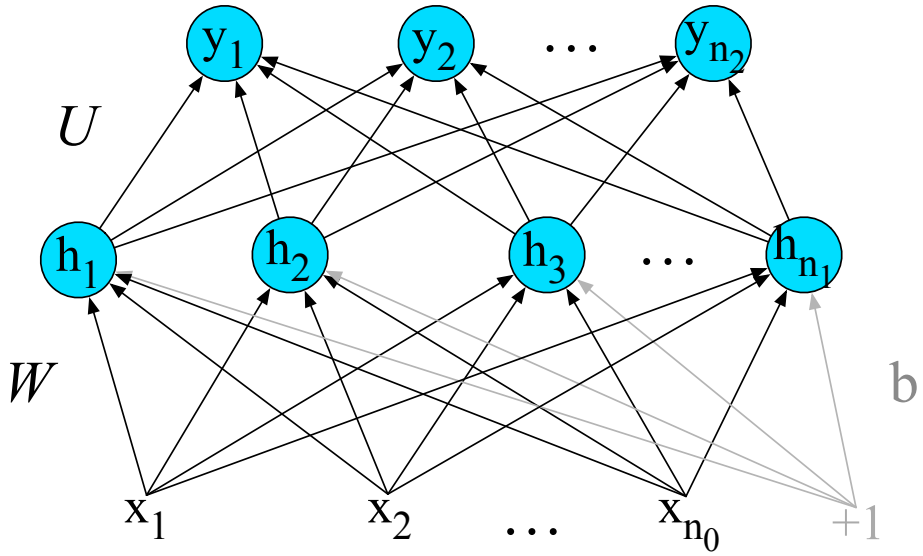

The XOR problem

Simple Neural Networks and Neural Language Models

Feedforward Neural Networks

Feedforward Neural Networks

Can also be called **multi-layer perceptrons** (or **MLPs**) for historical reasons

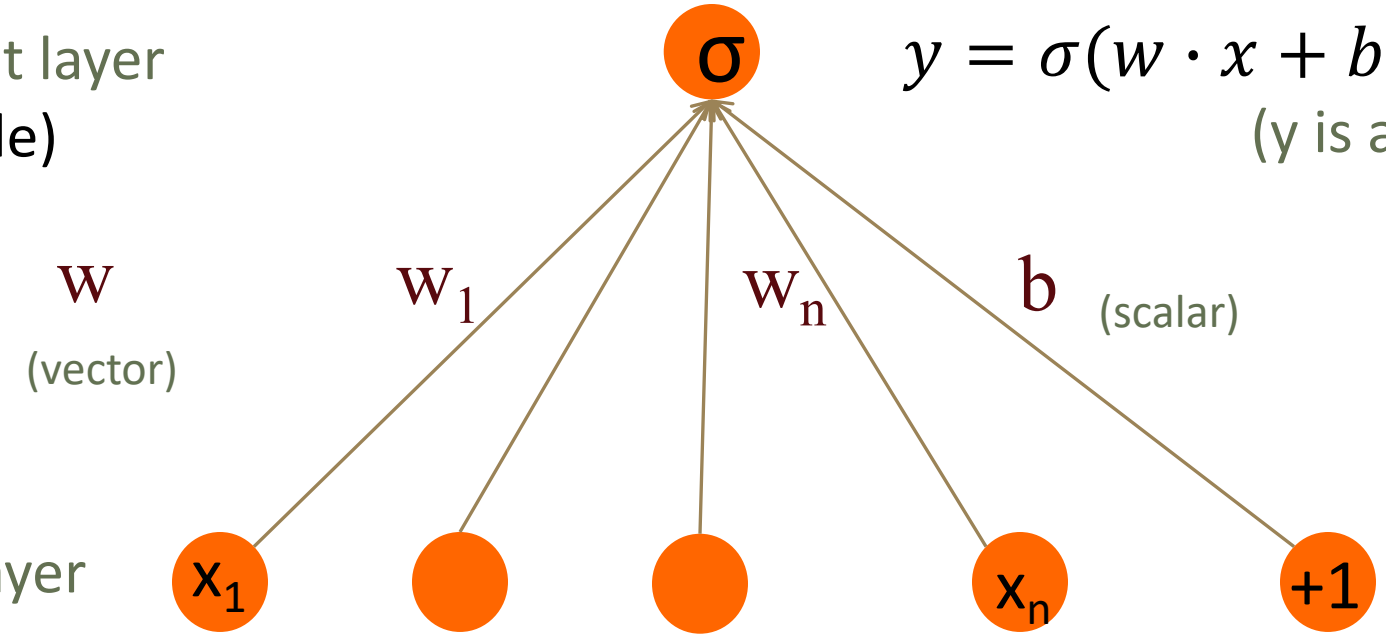

Binary Logistic Regression as a 1-layer Network

(we don't count the input layer in counting layers!)

Output layer
(σ node)

$$y = \sigma(w \cdot x + b)$$

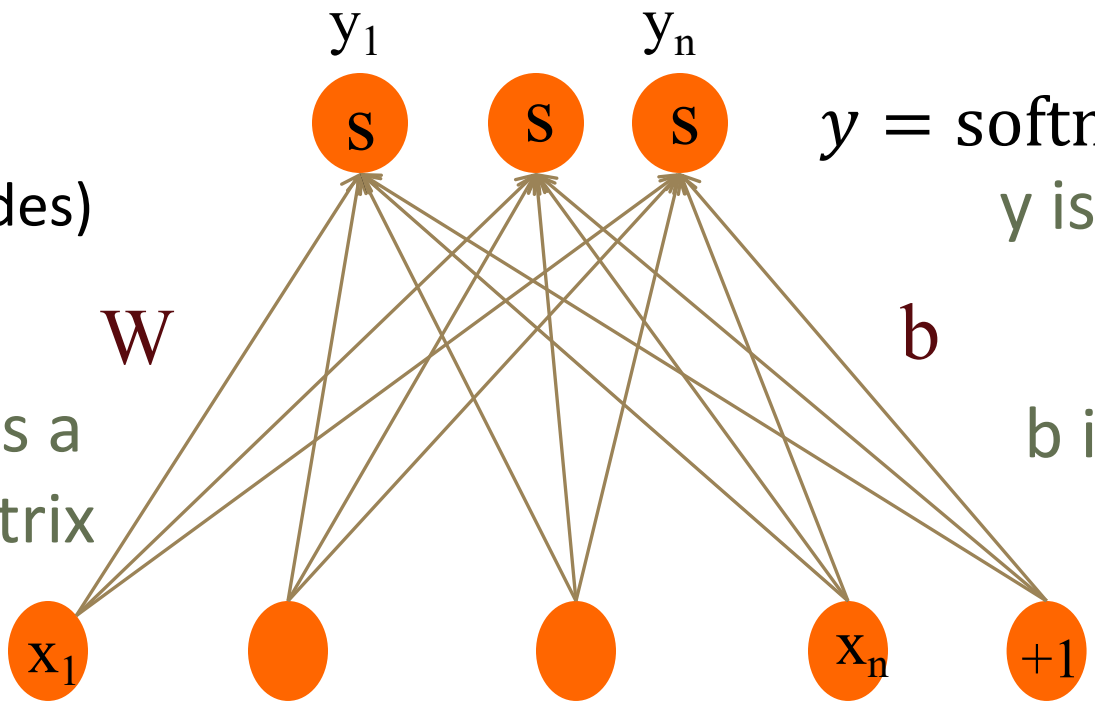

(y is a scalar)

Input layer
vector x

Multinomial Logistic Regression as a 1-layer Network

Fully connected single layer network

Output layer
(softmax nodes)

$$y = \text{softmax}(Wx + b)$$

y is a vector

W

b

W is a matrix

b is a vector

Input layer
scalars

Reminder: softmax: a generalization of sigmoid

For a vector *z* of dimensionality *k*, the softmax is:

$$\text{softmax}(z) = \left[\frac{\exp(z_1)}{\sum_{i=1}^{k} \exp(z_i)}, \frac{\exp(z_2)}{\sum_{i=1}^{k} \exp(z_i)}, \ldots, \frac{\exp(z_k)}{\sum_{i=1}^{k} \exp(z_i)} \right]$$

$$\text{softmax}(z_i) = \frac{\exp(z_i)}{\sum_{j=1}^{k} \exp(z_j)} \quad 1 \leq i \leq k$$

Example:

$$z = [0.6, 1.1, -1.5, 1.2, 3.2, -1.1]$$

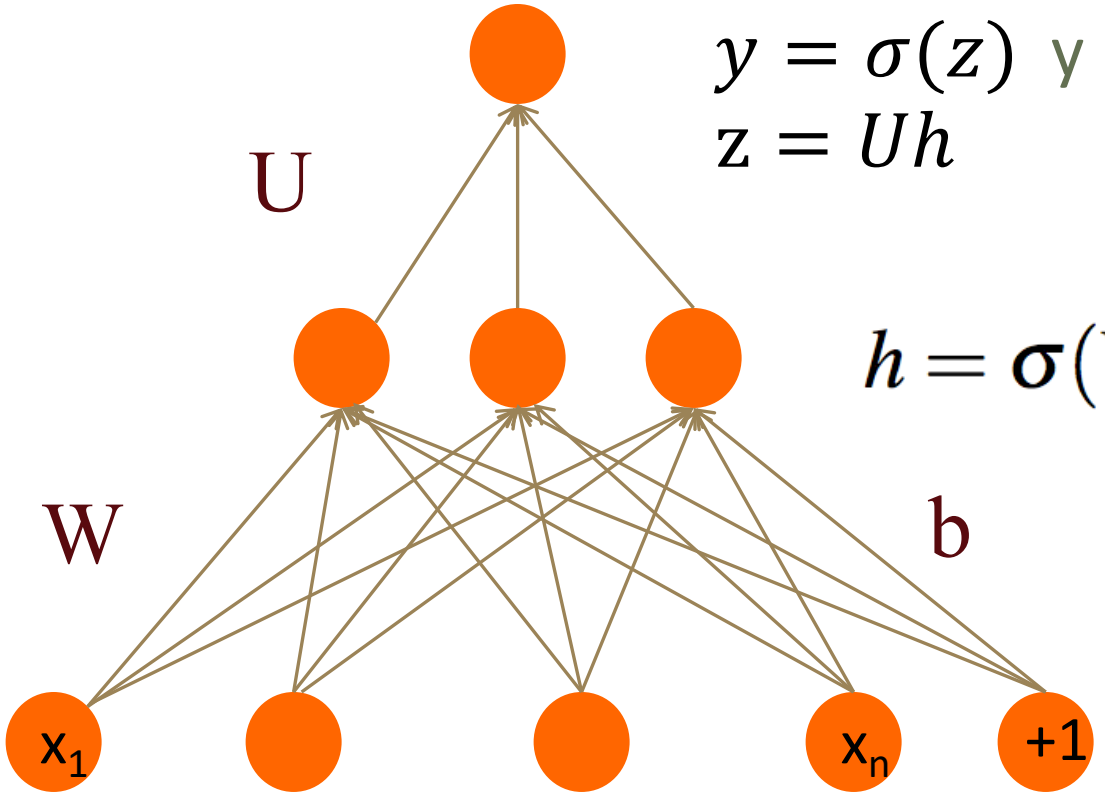

$$\text{softmax}(z) = [0.055, 0.090, 0.006, 0.099, 0.74, 0.010]$$

Two-Layer Network with scalar output

Output layer
(σ node)

hidden units
(σ node)

Input layer
(vector)

$y = \sigma(z)$ y is a scalar

$z = Uh$

$h = \sigma(Wx + b)$

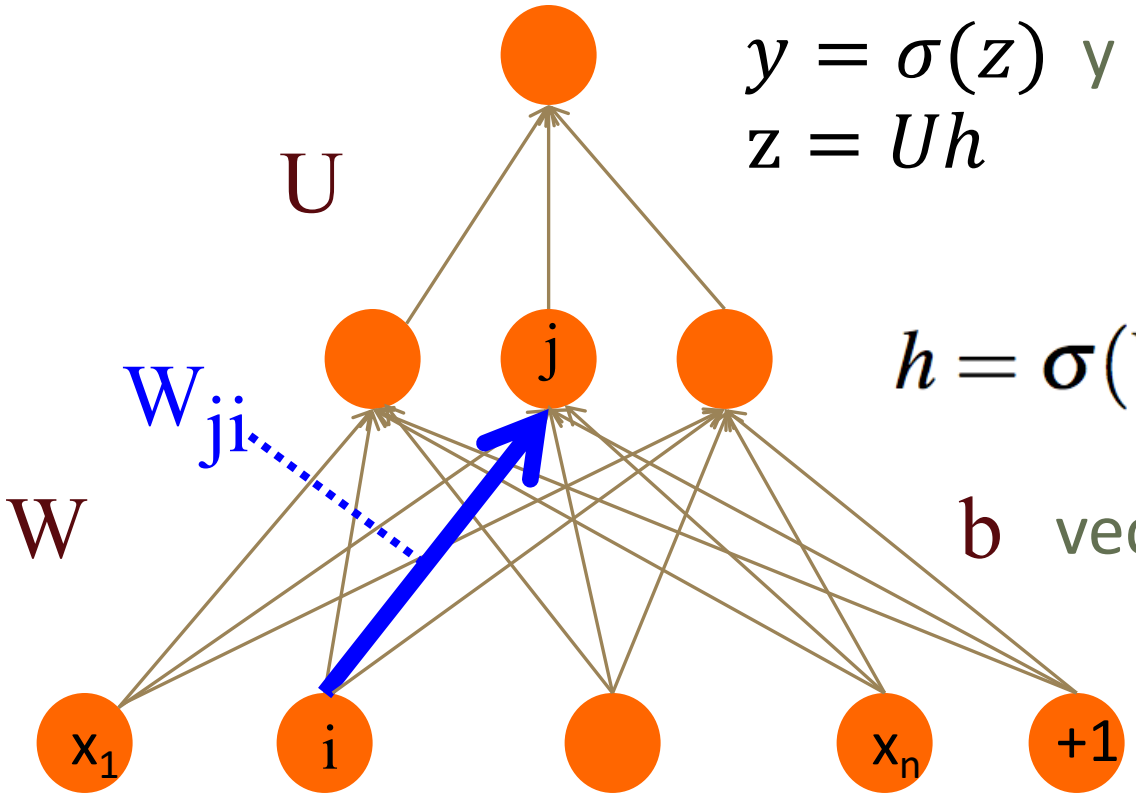

Could be ReLU
Or tanh

Two-Layer Network with scalar output

Output layer
(σ node)

hidden units
(σ node)

Input layer
(vector)

$y = \sigma(z)$ y is a scalar

$z = Uh$

$h = \sigma(Wx + b)$

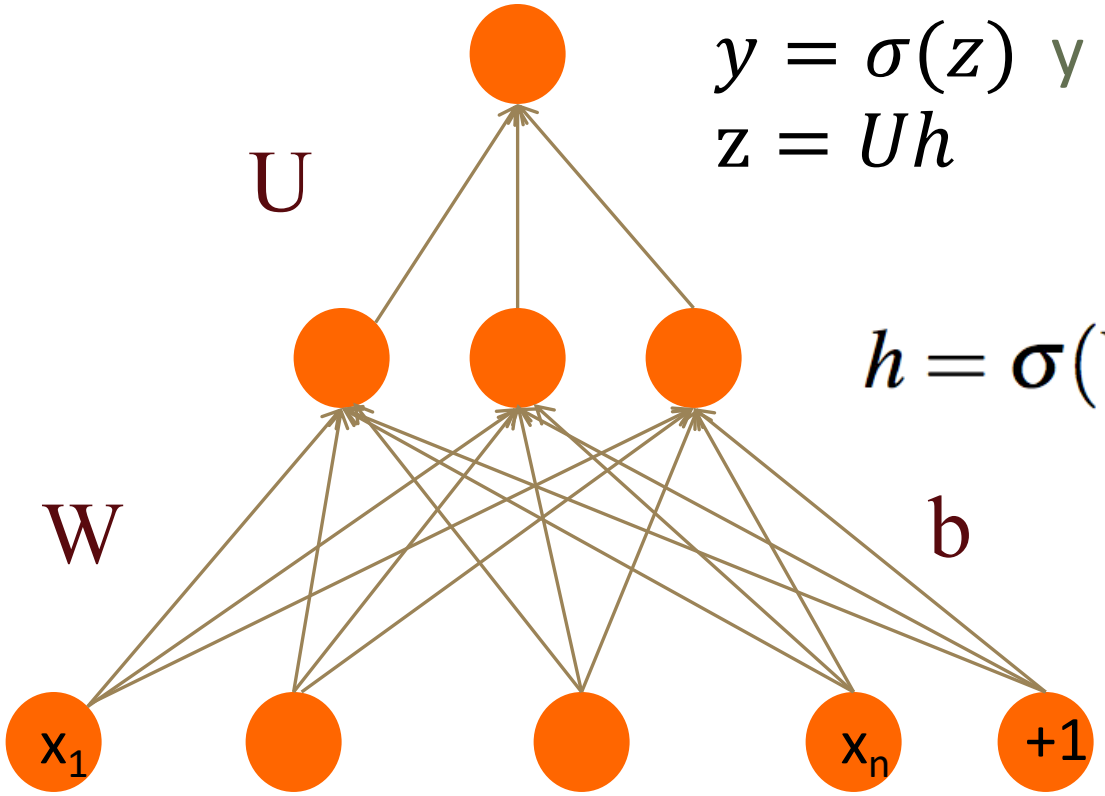

b vector

Two-Layer Network with scalar output

Output layer
(σ node)

hidden units
(σ node)

Input layer
(vector)

$y = \sigma(z)$ y is a scalar

$z = Uh$

$h = \sigma(Wx + b)$

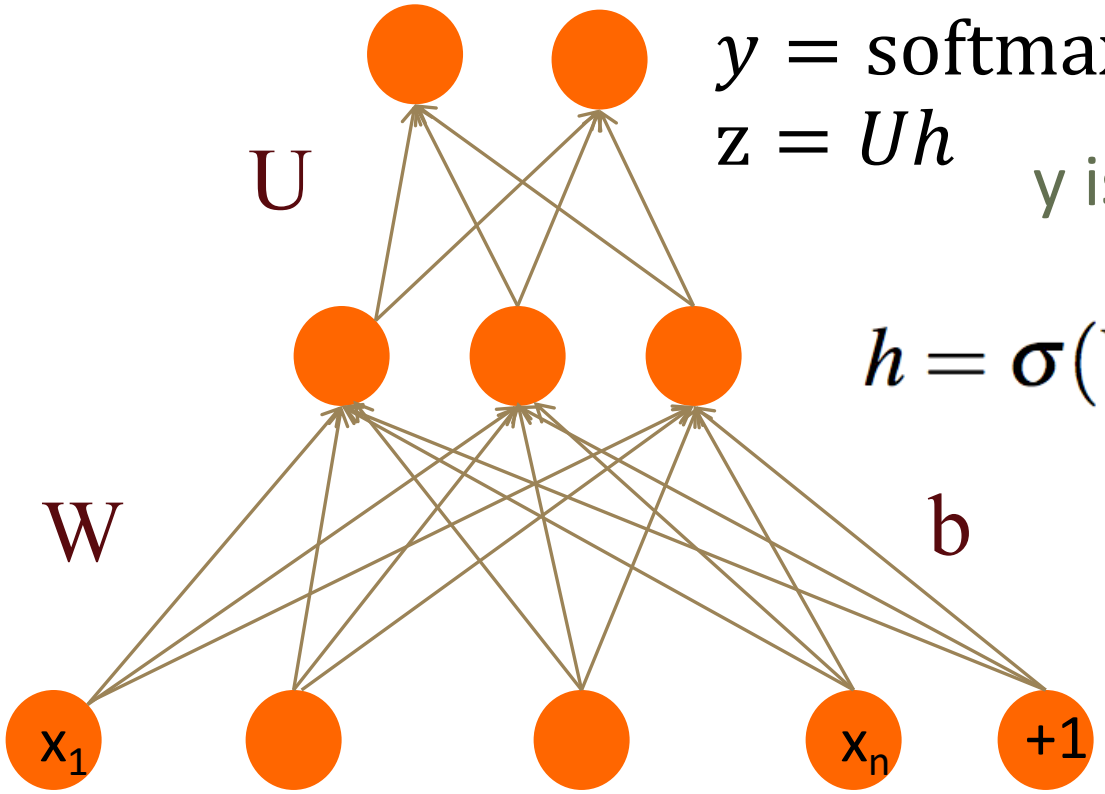

Could be ReLU
Or tanh

Two-Layer Network with softmax output

Output layer
(σ node)

hidden units
(σ node)

Input layer
(vector)

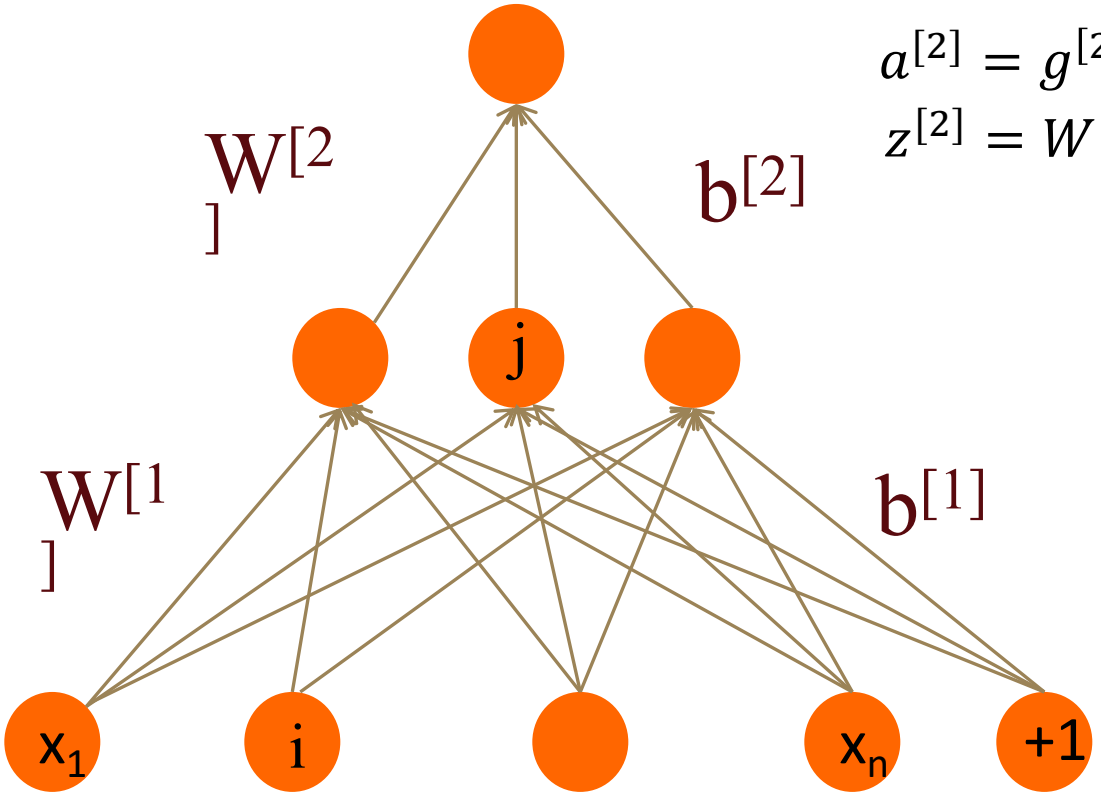

$$y = \text{softmax}(z)$$
$$z = Uh$$

y is a vector

$$h = \sigma(Wx + b)$$

Could be ReLU
Or tanh

Multi-layer Notation

$$y = a^{[2]}$$

$$a^{[2]} = g^{[2]}(z^{[2]})$$ sigmoid or softmax

$$z^{[2]} = W^{[2]}a^{[1]} + b^{[2]}$$

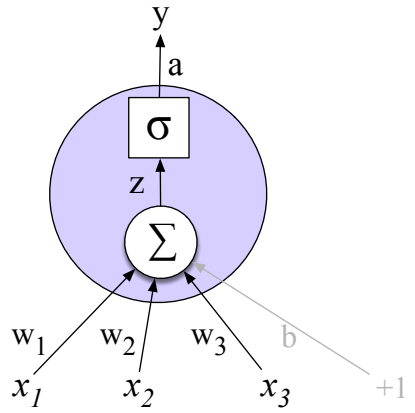

$$a^{[1]} = g^{[1]}(z^{[1]})$$ ReLU

$$z^{[1]} = W^{[1]}a^{[0]} + b^{[1]}$$

$a^{[0]}$

Multi Layer Notation

$$
\begin{aligned}
z^{[1]} &= W^{[1]} a^{[0]} + b^{[1]} \\
a^{[1]} &= g^{[1]}(z^{[1]}) \\
z^{[2]} &= W^{[2]} a^{[1]} + b^{[2]} \\
a^{[2]} &= g^{[2]}(z^{[2]}) \\
\hat{y} &= a^{[2]}
\end{aligned}
$$

for i **in** 1..n

$$
\begin{aligned}
z^{[i]} &= W^{[i]} a^{[i-1]} + b^{[i]} \\
a^{[i]} &= g^{[i]}(z^{[i]}) \\
\hat{y} &= a^{[n]}
\end{aligned}
$$

Replacing the bias unit

Let's switch to a notation without the bias unit

Just a notational change

1. Add a dummy node $a_0=1$ to each layer
2. Its weight w_0 will be the bias
3. So input layer $a^{[0]}_0=1$,
   - And $a^{[1]}_0=1$, $a^{[2]}_0=1$,…

Replacing the bias unit

Instead of:

$$x = x_1, x_2, \ldots, x_{n0}$$

$$h = \sigma(Wx + b)$$

$$h_j = \sigma\left(\sum_{i=1}^{n_0} W_{ji} x_i + b_j\right)$$

We'll do this:

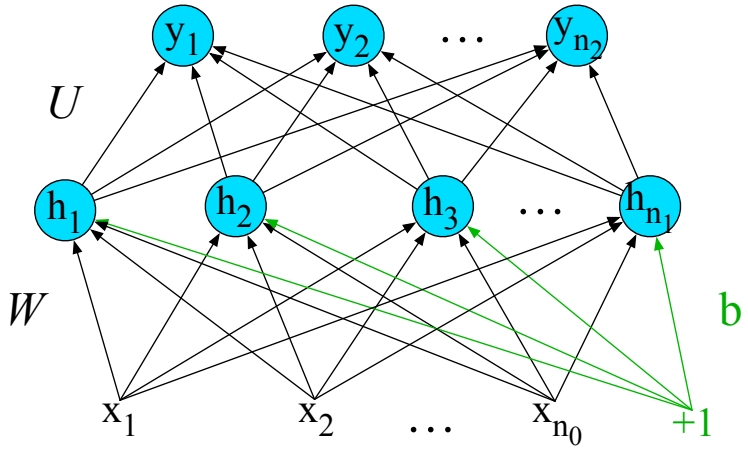

$$x = x_0, x_1, x_2, \ldots, x_{n0}$$

$$h = \sigma(Wx)$$

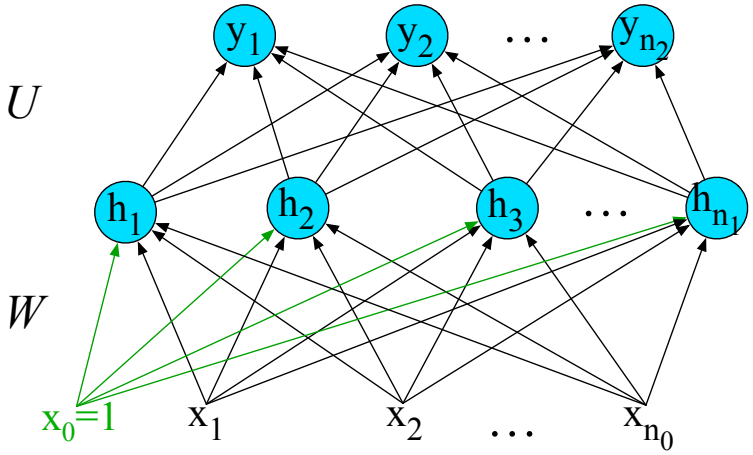

$$\sigma\left(\sum_{i=0}^{n_0} W_{ji} x_i\right)$$

Replacing the bias unit

Instead of:

We'll do this:

Simple Neural Networks and Neural Language Models

Feedforward Neural Networks

Simple Neural Networks and Neural Language Models

Applying feedforward networks to NLP tasks

Use cases for feedforward networks

Let's consider 2 (simplified) sample tasks:

1. Text classification
2. Language modeling

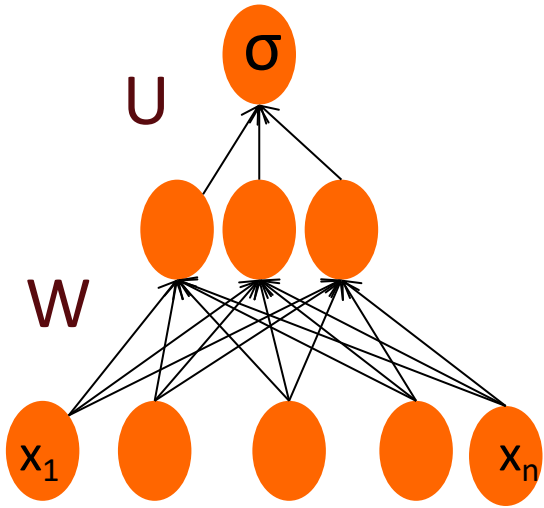

State of the art systems use more powerful neural architectures, but simple models are useful to consider!

Classification: Sentiment Analysis

We could do exactly what we did with logistic regression

Input layer are binary features as before

Output layer is 0 or 1

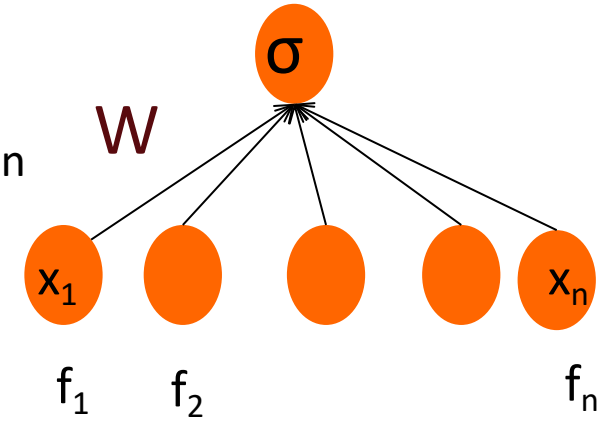

Sentiment Features

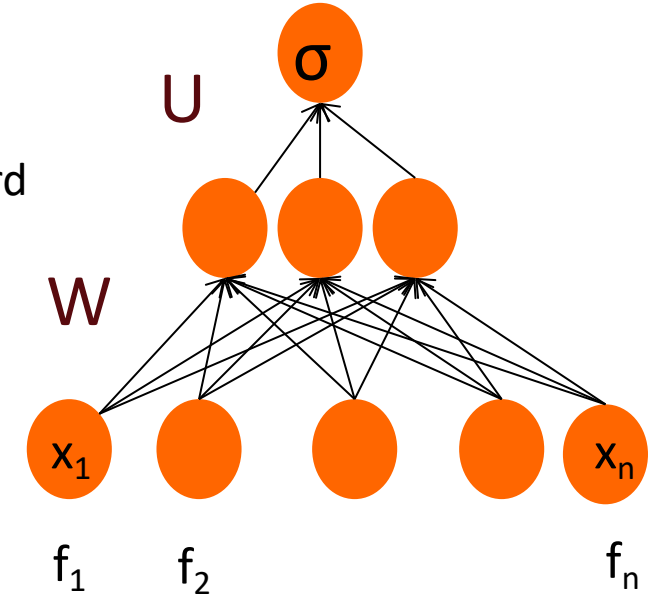

Var	Definition
x_1	$\text{count}(\text{positive lexicon}) \in \text{doc})$
x_2	$\text{count}(\text{negative lexicon}) \in \text{doc})$
x_3	$\begin{cases} 1 & \text{if } \text{“no”} \in \text{doc} \\ 0 & \text{otherwise} \end{cases}$
x_4	$\text{count}(\text{1st and 2nd pronouns} \in \text{doc})$
x_5	$\begin{cases} 1 & \text{if } \text{“!”} \in \text{doc} \\ 0 & \text{otherwise} \end{cases}$
x_6	$\log(\text{word count of doc})$

Feedforward nets for simple classification

Logistic Regression

2-layer feedforward network

Just adding a hidden layer to logistic regression

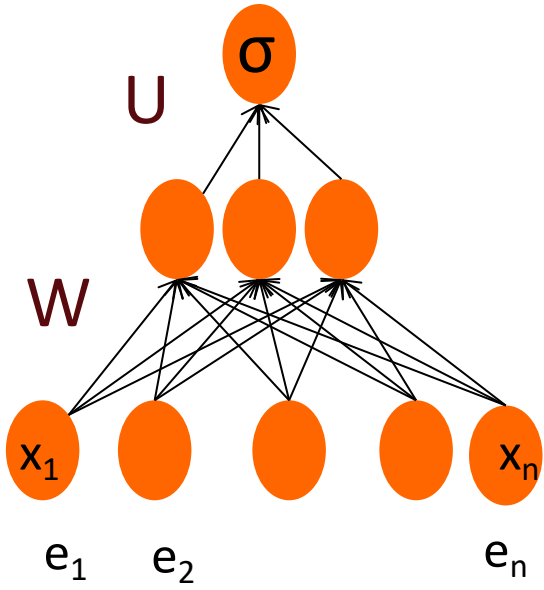

- allows the network to use non-linear interactions between features
- which may (or may not) improve performance.

Even better: representation learning

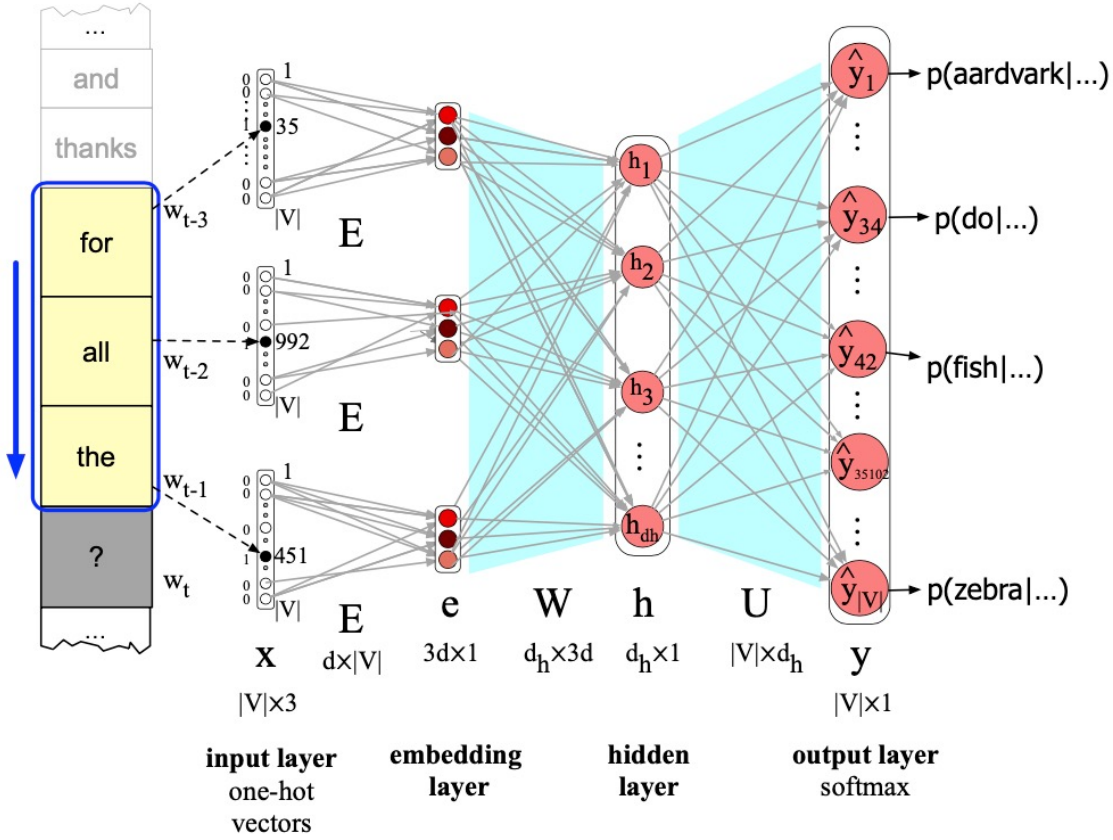

The real power of deep learning comes from the ability to **learn** features from the data

Instead of using hand-built human-engineered features for classification

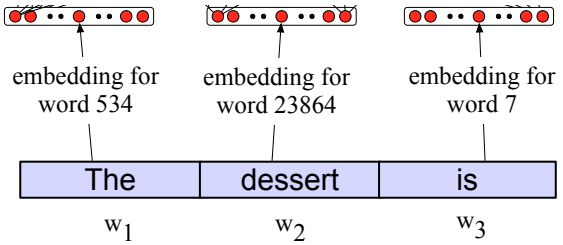

Use learned representations like embeddings!

Neural Net Classification with embeddings as input features!

Issue: texts come in different sizes

This assumes a fixed size length (3)!

Kind of unrealistic.

Some simple solutions (more sophisticated solutions later)

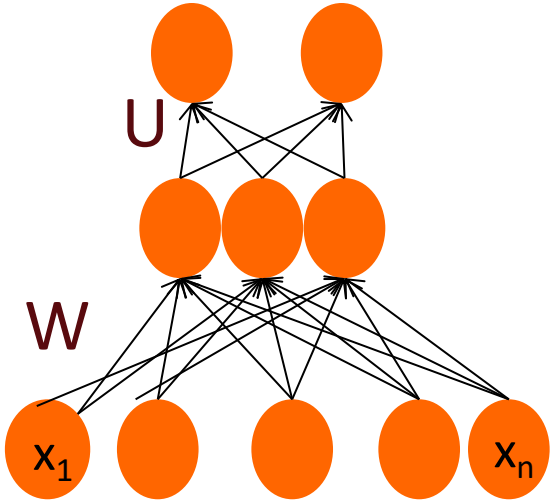

1. Make the input the length of the longest review
   - If shorter then pad with zero embeddings
   - Truncate if you get longer reviews at test time
2. Create a single "sentence embedding" (the same dimensionality as a word) to represent all the words
   - Take the mean of all the word embeddings
   - Take the element-wise max of all the word embeddings
     - For each dimension, pick the max value from all words

Reminder: Multiclass Outputs

What if you have more than two output classes?

- Add more output units (one for each class)
- And use a “softmax layer”

$$\text{softmax}(z_i) = \frac{e^{z_i}}{\sum_{j=1}^{k} e^{z_j}} \quad 1 \leq i \leq D$$

Neural Language Models (LMs)

Language Modeling: Calculating the probability of the next word in a sequence given some history.

- We've seen N-gram based LMs
- But neural network LMs far outperform n-gram language models

State-of-the-art neural LMs are based on more powerful neural network technology like Transformers

But **simple feedforward LMs** can do almost as well!

Simple feedforward Neural Language Models

Task: predict next word w_t

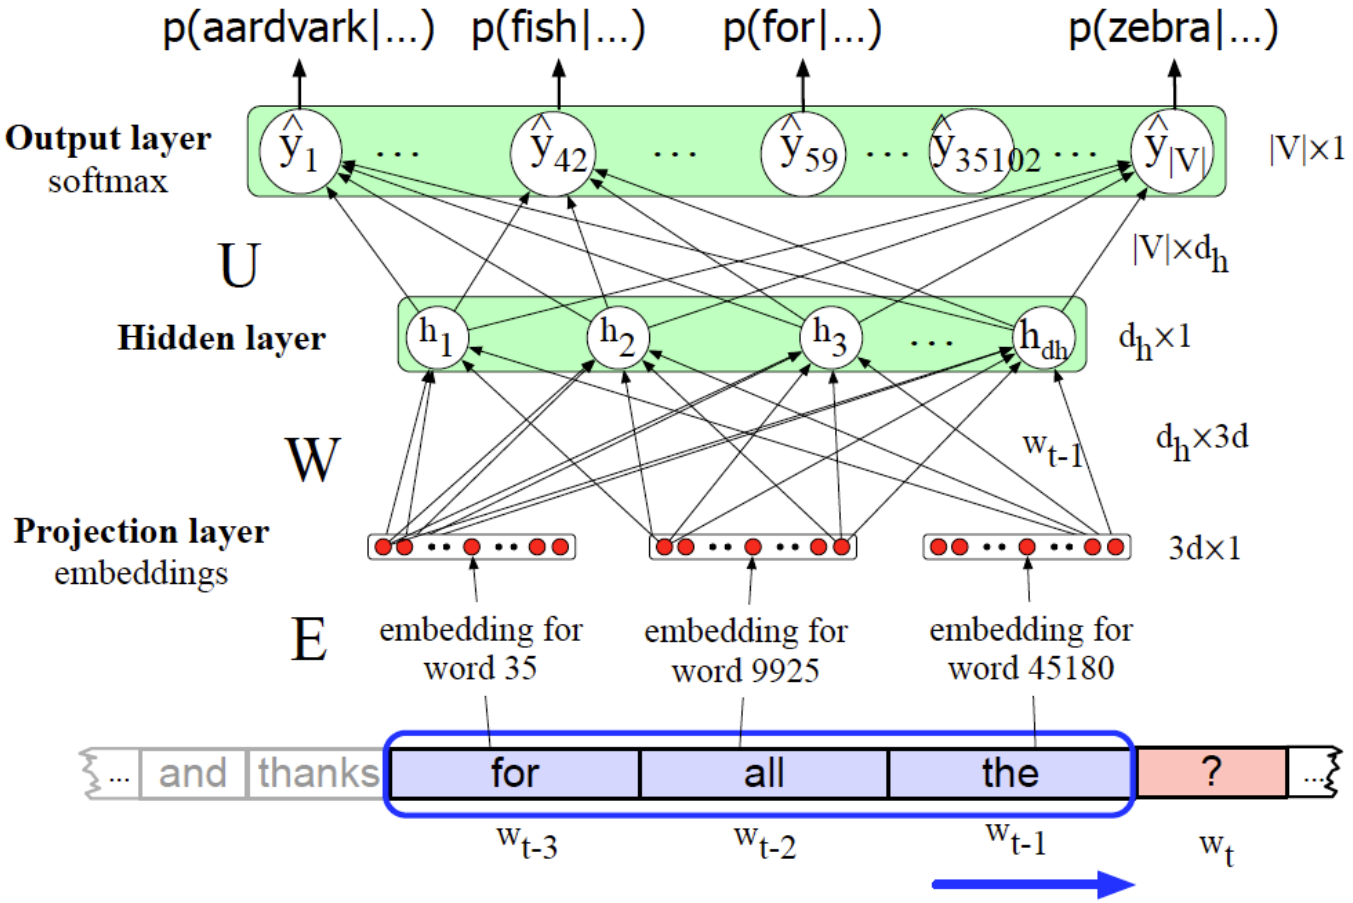

given prior words w_{t-1}, w_{t-2}, w_{t-3}, …

Problem: Now we're dealing with sequences of arbitrary length.

Solution: Sliding windows (of fixed length)

$$P(w_t|w_1^{t-1}) \approx P(w_t|w_{t-N+1}^{t-1})$$

Neural Language Model

Why Neural LMs work better than N-gram LMs

Training data:

We've seen: I have to make sure that the cat gets fed.

Never seen: dog gets fed

Test data:

I forgot to make sure that the dog gets ___

N-gram LM can't predict "fed"!

Neural LM can use similarity of "cat" and "dog" embeddings to generalize and predict “fed” after dog
